

Home Assignment 1: Convert TestScript to Page Object Model

Learning Objective:

Understand to create a structured framework that enhances code modularity and maintainability by separating page elements and actions into distinct page classes, improving test script readability and reducing duplication.

Expected Completion Time:

Best Case: 20 minutes

Average Case: 30 minutes

Assignment Details:

To create a Page Object Model design pattern for a given test case from the scratch.

Requirements:

Implement Create Account test case using the Page Object Model (POM) design pattern.

Steps to follow:

Step 1: Create a new maven project
Create a dedicated project for POM (PageObjectModel).

Step 2: Dependency Management
Add required dependencies into the pom.xml file.

Step 3: Package Structure
Create 4 packages to organize code into logical packages.

- base
- pages
- testcase
- utils

Step 4: ProjectSpecificMethods for common functionalities inside base package.
Develop two methods preCondition and postCondition in the ProjectSpecificMethods.

In preCondition:

- *Initialize WebDriver.
- *Set up implicit waits.
- *Maximize the browser window.
- *Navigate to the application's URL.

In postCondition:

- *Close the browser.

Step 5: Design the pages
Create classes for each page.

- LoginPage
- WelcomePage
- MyHomePage
- MyAccountPage
- CreateAccountPage
- ViewAccountPage

Step 6: Inherit common steps to all pages

Ensure all classes should extend with ProjectSpecificMethod.

Step 7: Method Naming Conventions

Use meaningful method names in page classes.

Step 8: Return Statements

Include return statements in all the methods in pages.

-If the control stays in the same page return this and change the return type

-If the control moves to another page then add return statement according to it page

Step 9: Test Case Classes

Create test case classes in test case package (e.g., TC_001_LoginPage).

Step 10: Page Object Initialization

- Instantiate page objects in test cases.
